Introducing Brainzheimer/Brain Training

The revolutionary brain training application "Brainzheimer", specifically adapted for Alzheimer's disease patients, helps patients to improve their thinking skills.

Munich University of Applied Sciences - October 31, 2019.

Today, four students from the Munich University of Applied Sciences introduced a new Alexa Skill called "Brainzheimer". It is designed to help Alzheimer's patients to improve their cognitive skills through an innovative brain training and provides individuality through a dynamically customized ability system. This system works by asking ten entry-level questions in different subject areas, e.g., in mathematics or history, and using them as a base for further questions.

"Our goal is to help Alzheimer's patients to train their brain and strengthen their memory in the best possible way. Our app is fun to use, adapts the training to the user and provides levels with different degrees of difficulty. In addition, we keep developing the app to provide even better services in the future", said the group of young developers.
